Public CAD Co-edit Structures

Supplementary to *Budget Anchored Region Reduction for Collaborative Responsibility Repair*

Zhiran Wang | Ocean University of China | 2174560006@qq.com

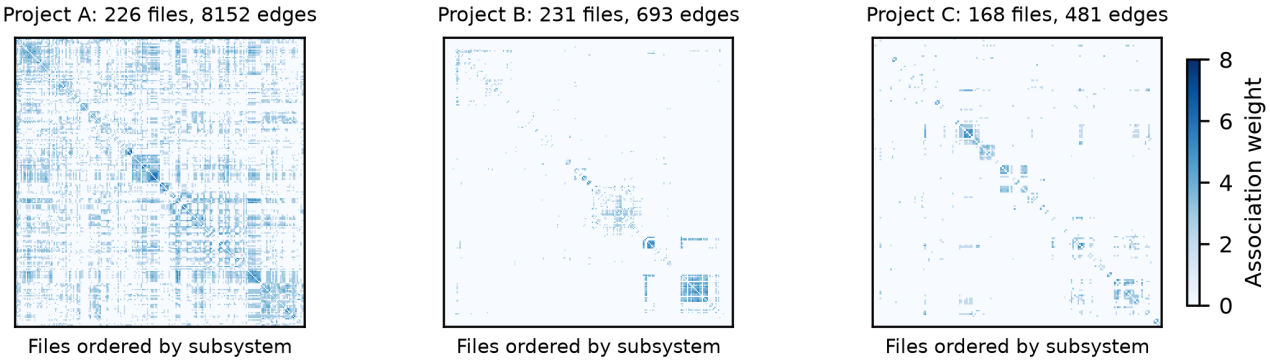

Figure S1. Original three-panel BARR v5 figure, restored unchanged. Twelve-hour co-edit proxy matrices for projects A, B and C from the public Bath CAD logs [1, 2]. Rows and columns use the same subsystem/file-ID ordering. Color denotes quantized association weight, not measured handoff effort. Isolated files remain.

Construction. Files have at least five distinct edit times. For each edit, another file counts once before the earlier of the next same-file edit and the one- or twelve-hour window end. Average the directional conditional frequencies, retain pairs at least 1/4, and round after scaling by eight. Table S1 includes both windows used by the paper.

Table S1. Structure of all six saved public graphs. The figure displays the twelve-hour rows.

Project	Window (h)	Files	Edges	Components	Largest component	Isolates
A	1	226	2,726	3	224	2
A	12	226	8,152	1	226	0
B	1	231	535	94	79	82
B	12	231	693	63	161	56
C	1	168	199	78	45	62
C	12	168	481	46	101	36

Interpretation and scope. A/B/C identify three historical vehicle-design projects, not the two modeled responsibility teams. Co-edit association is not a verified physical interface. Ownership, costs, qualifications and capacity reservations remain synthetic or assumed. In the 72 saved repair cases, 66 finish by the shared unconstrained-cut shortcut; only six require constrained solving. The matrices describe public graph structure and do not establish industrial acceleration.
